

METHOD FOR SELECTIVE MID-CALL CALL FORWARDING FROM MOBILE STATION

ABSTRACT OF DISCLOSURE

A method for providing selective mid-call call forwarding from a mobile station associated with a subscriber to a wireless service provider is provided. In one embodiment, the method includes: a) receiving an incoming call, b) ringing the mobile station, c) receiving a mid-call call forwarding activation from the mobile station, d) retrieving a telephone number associated with the mid-call call forwarding activation from a service plan associated with the subscriber, and e) forwarding the incoming call to a telephone device associated with the retrieved telephone number. In another embodiment, the mid-call call forwarding activation is a control signal resulting from a user pressing at least one key on the mobile station. In other aspects, a method of adding and/or modifying a selective mid-call call forwarding feature to a service plan associated with the subscriber is provided.
